Flexor 7070-324

4-channel 500 MHz 16-bit A/D, 4-channel 2 GHz 16-bit D/A PCIe board with Virtex-7 FPGA

Complete radar and software radio interface solution

- Radar and communication receiver and transmitter
- Electronic Warfare transponder
- Waveform signal generator
- Wideband data acquisition
- Remote monitoring
- Sensor interfaces

Model 7070-324 is a member of the Flexor® family of high-performance PCIe boards based on the Xilinx Virtex-7 FPGA. As a FlexorSet® integrated solution, the Model 3324 FMC is factory-installed on the 7070 FMC carrier. The required FPGA IP is installed and the board set is delivered ready for immediate use.

The delivered FlexorSet is a multichannel, high-speed data converter and is suitable for connection to the HF or IF ports of a communications or radar system. Its built-in data capture and playback features offer an ideal turnkey solution as well as a platform for developing and deploying custom FPGA processing IP.

It includes four 500 MHz, 16-bit A/Ds, four digital upconverters, four 2 GHz, 16-bit D/As, and four banks of memory. In addition to supporting PCIe Gen. 3 as a native interface, the Model 7070-324 includes optional copper and optical connections to the Virtex-7 FPGA for custom I/O.

FEATURES

- Supports Xilinx® Virtex®-7 VXT FPGA
- GateXpress® supports dynamic FPGA reconfiguration across PCIe
- Four 500 MHz 16-bit A/Ds
- Four DUCs (digital upconverters)
- Four 2 GHz 16-bit D/As (500 MHz input date rate, 2 GHz output sample rate with interpolation)
- 4 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- Optional optical Interface for backplane gigabit serial interboard communication

THE FLEXOR ARCHITECTURE

Based on the proven design of the Mercury Onyx family of Virtex-7 products, the 7070 FMC carrier retains all the key features of that family. As a central foundation of the board architecture, the FPGA has access to all data and control paths of both the carrier board and the FMC module, enabling factory-installed functions that include data multiplexing, channel selection, data packing, gating, triggering and memory control.

When delivered as an assembled board set, the 7070-324 includes factory-installed applications ideally matched to the board's analog interfaces. The functions include four A/D acquisition IP modules for simplifying data capture and data transfer. Each of the four acquisition IP modules contains IP modules for DDR3 SDRAM memories.

The 7070-324 features four sophisticated D/A waveform playback IP modules. A linked-list controller allows users to easily play back to the D/As waveforms stored in either on-board or off-board host memory. Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

In each playback module, up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming.

A controller for all data clocking and synchronization functions, a test signal generator, and a PCIe interface complete the factory-installed functions and enable the 7070-324 to operate as a turnkey solution without the need to develop any FPGA IP.

EXTENDABLE IP DESIGN

For applications that require specialized functions, users can install their own custom IP for data processing. Mercury GateFlow® FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Mercury factory-installed functions or use the GateFlow kit to completely replace the Mercury IP with their own.

XILINX VIRTEX-7 FPGA

The Xilinx Virtex-7 FPGA site can be populated with one of two FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

GATEXPRESS FOR FPGA CONFIGURATION

The Onyx architecture includes GateXpress®, a sophisticated FPGA-PCIe configuration manager for loading and reloading the FPGA. At power up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on most PCs.

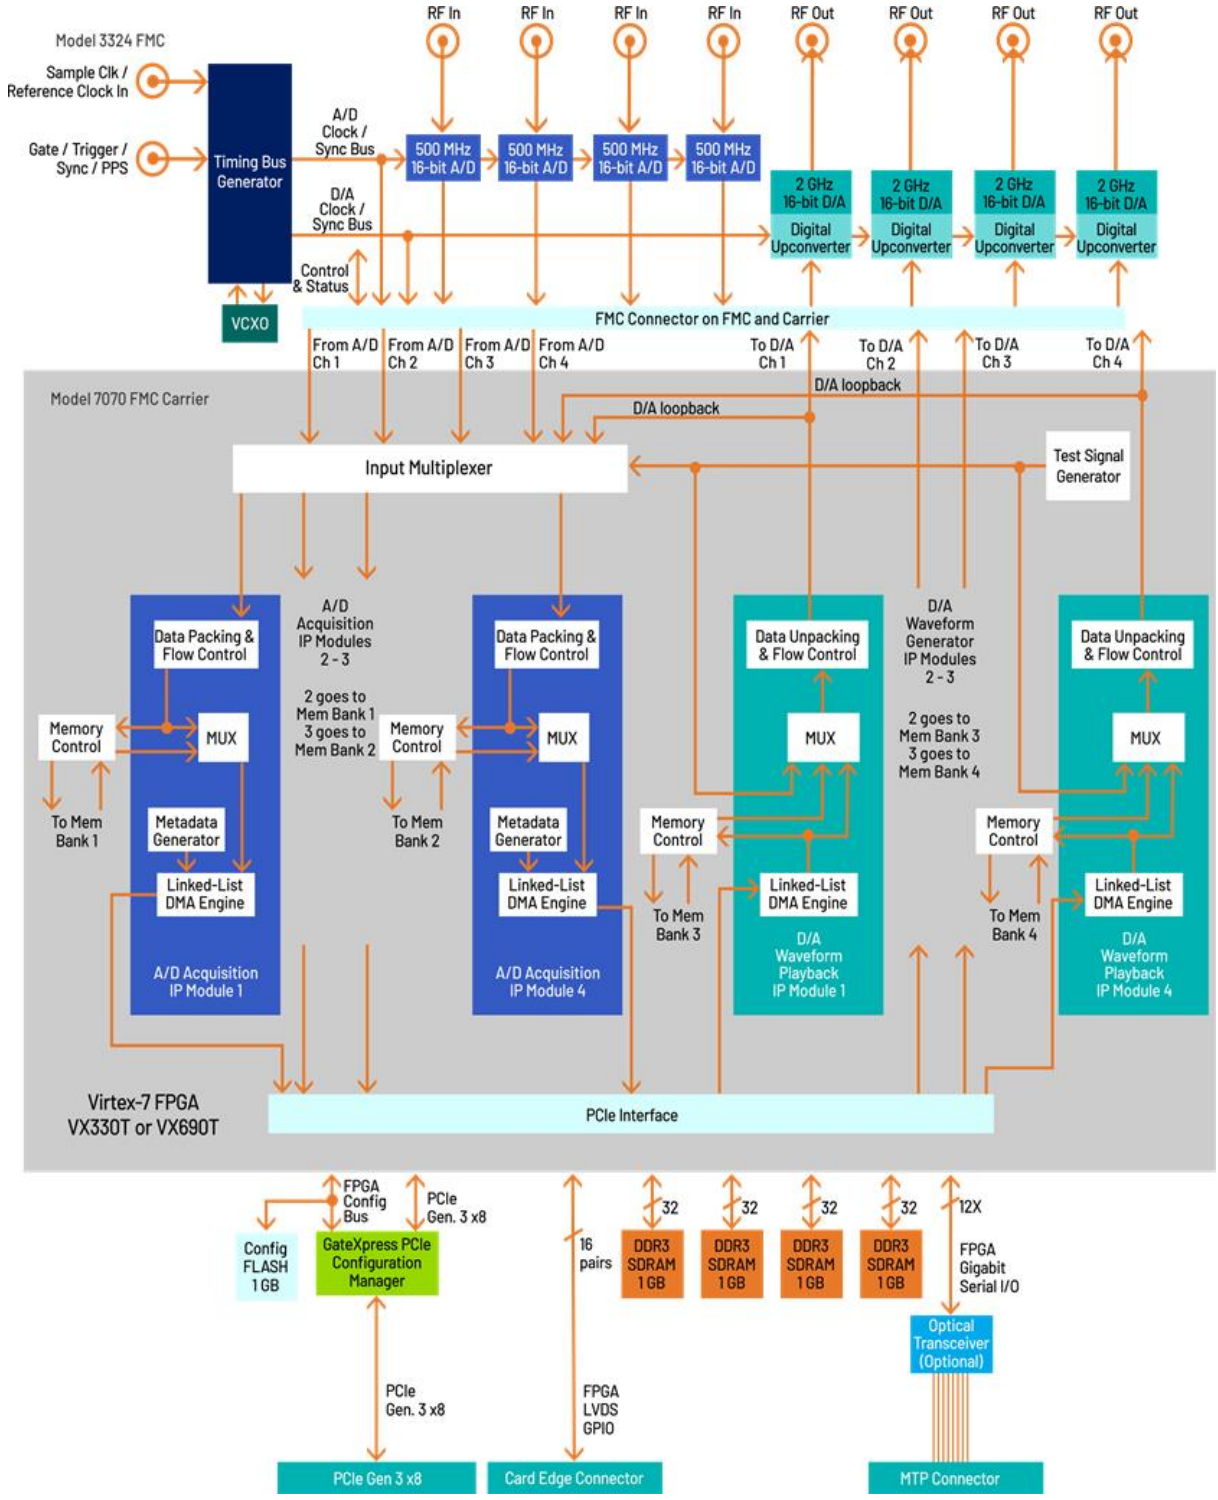
The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power up the user can choose which image will load based on a hardware switch setting. Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image:

- The first is the option to load an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.
- The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in nonvolatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of a mission, images can be stored on the host computer and loaded through PCIe as needed.
- The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without a host computer reset to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

7070-324 BLOCK DIAGRAM

Click on a block for more information.



A/D CONVERTER STAGE

The board's analog interface accepts four analog HF or IF inputs on front-panel connectors with transformer-coupling into 500 MHz, 16-bit A/D converters.

A/D ACQUISITION IP MODULES

The 7070-324 features four A/D Acquisition IP Modules for easy capture and data moving. Each IP module can receive data from any of the four A/Ds, a test signal generator or from the D/A Waveform Playback IP Modules in loopback mode.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample accurate time stamp, and data length information. These actions simplify the host processor's job of identifying and executing on the data.

D/A WAVEFORM GENERATOR IP MODULE

The 7070-324 factory-installed functions include two sophisticated D/A Waveform Generator IP modules. A linked-list controller allows users to easily record waveforms stored in either onboard or off-board host memory to the two D/As.

Parameters including length of waveform, delay from trigger, waveform repetition, etc. can be programmed for each waveform. Up to 64 individual link entries per module can be chained together to create complex waveforms with a minimum of programming.

DIGITAL UPCONVERTER AND D/A STAGE

Four D/As accept baseband real or complex data streams from the FPGA. Each stream then passes through the upconvert, interpolate and D/A stages of the converter.

When operating as DUCs (digital upconverters), the converters interpolate and translate real or complex baseband input signals to a programmable IF center frequency. The data is then delivered to the 16-bit D/A converter stages. Analog outputs are through front panel connectors.

If translation is disabled, the D/As act as interpolating 16-bit D/As with output sampling rates up to 2 GHz. In both modes the D/As provide interpolation factors of 2x, 4x, 8x and 16x.

CLOCKING AND SYNCHRONIZATION

An internal timing bus provides all timing and synchronization required by the A/D converters. Included are a clock, sync and gate or trigger signals. An on-board clock generator can receive an external sample clock from the front-panel coaxial connector. This clock can be used directly by the A/D section or divided by a built-in clock synthesizer circuit.

In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front-panel coaxial connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel Gate/Trigger/PPS connector can receive an external timing signal allowing multiple boards to be synchronized to create larger multiboard systems.

MEMORY RESOURCES

The Model 7070-324 architecture supports four independent DDR3 SDRAM memory banks. Each bank is 1 GB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets.

PCI EXPRESS INTERFACE

The Model 7070-324 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

READYFLOW

Mercury provides ReadyFlow® BSPs (Board Support Packages) for all Cobalt, Onyx, and Flexor products. Available for both Linux and Windows, these packages:

- Provide a path for quick start-up through application completion
- Allow programming at high, intermediate and low levels to meet various needs
- Are illustrated with numerous examples
- Include complete documentation and definitions of all functions
- Include library and example source code.

ReadyFlow BSPs contain C-language examples that can be used to demonstrate the capabilities of Cobalt, Onyx, and Flexor products. These programming examples will help you get an immediate start on writing your own application. They provide sample code that is known to work, giving you a means of verifying that your board set is operational.

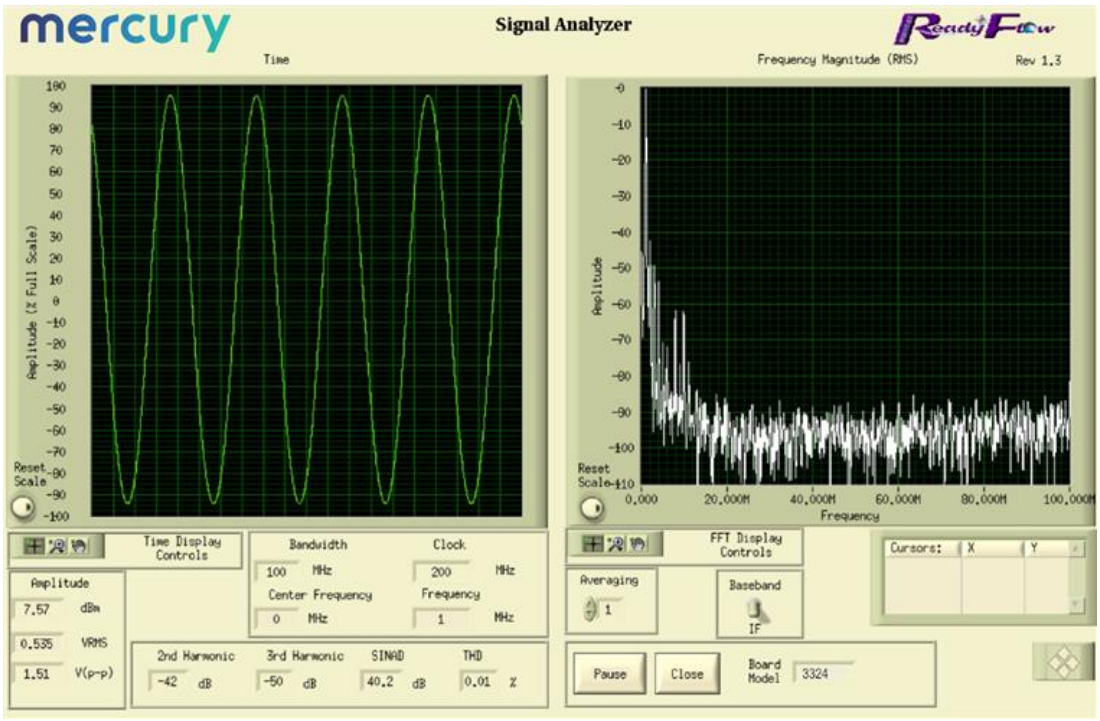
COMMAND LINE INTERFACE

The Command Line Interface provides access to pre-compiled executable examples that operate the hardware right out of the box, without the need to write any code. Board-specific hardware operating arguments can be entered in the command line to control parameters: number of channels to enable, sample clock frequency, data transfer size, reference clock frequency, reference clock source, etc.

The Command Line Interface can be used to call an example application from within a larger user application to control the hardware, and parameter arguments are passed to the application for execution. Functions that control data acquisition automatically save captured data to a pre-named host file or are routed to the Signal Analyzer example function for display.

SIGNAL ANALYZER

When used with the Command Line Interface, the Signal Analyzer allows users to immediately start acquiring and displaying A/D data. A full-featured analysis tool, the Signal Analyzer displays data in time and frequency domains. Built-in measurement functions display 2nd and 3rd harmonics, THD, and SINAD. Interactive cursors allow users to mark data points and instantly calculate amplitude and frequency of displayed signals.



GATEFLOW

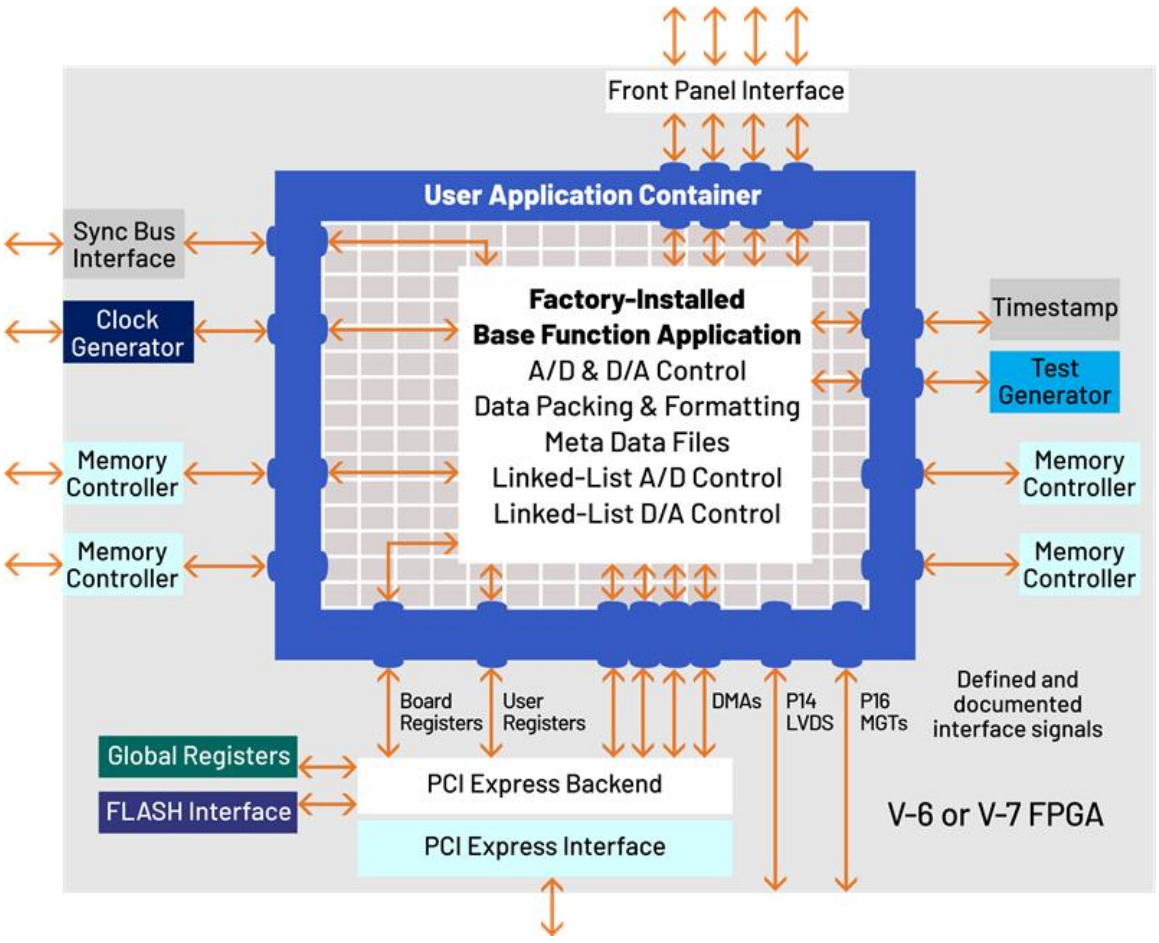
The GateFlow® FPGA Design Kit (FDK) allows the user to modify, replace and extend the standard installed functions in the FPGA to incorporate special modes of operation, new control structures, and specialized signal-processing algorithms.

The Cobalt (Virtex-6), Onyx (Virtex-7), and Flexor (Virtex-7) architectures configure the FPGA with standard factory-supplied interfaces including memory controllers, DMA engines, A/D and D/A interfaces, timing and synchronization structures, triggering and gating logic, time stamping and header tagging, data formatting engines, and the PCIe interface. These resources are connected to the User Application Container using well-defined ports that present easy-to-use data and control signals, effectively abstracting the lower-level details of the hardware.

The User Application Container

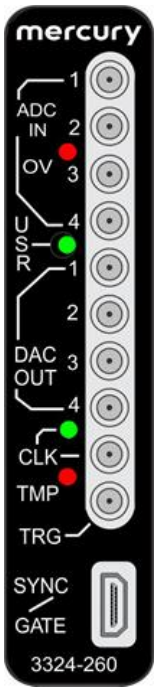
Shown below is the FPGA block diagram of a typical Cobalt, Onyx or Flexor module. The User Application Container holds a collection of different installed IP modules connected to the various interfaces through the standard ports surrounding the container. The specific IP modules for each product are described in further detail in the datasheet of that product.

The GateFlow FDK provides a complete Xilinx's ISE or Vivado project folder containing all the files necessary for the FPGA developer to recompile the entire project with or without any required changes. VHDL source code for each IP module provides excellent examples of how the IP modules work, how they might be modified, and how they might be replaced with custom IP to implement a specific function.



FRONT PANEL CONNECTIONS

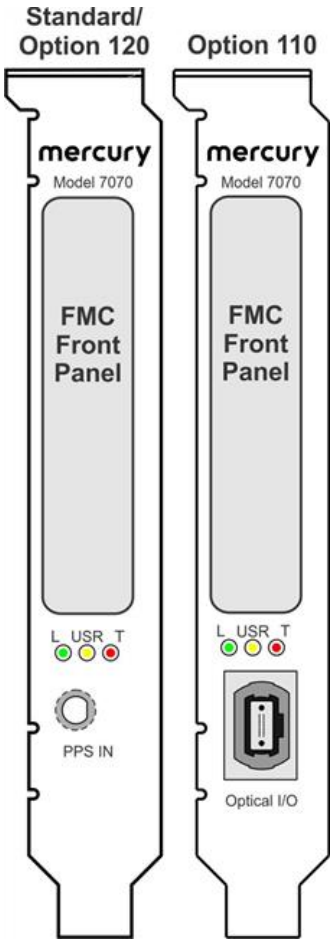
The FMC front panel includes ten SSMC coaxial connectors, and a 19-pin µSync connector for input/output of timing and analog signals. The front panel also includes four LEDs.



- **Analog Input Connectors:** Four coaxial connectors labeled **ADC IN 1, 2, 3**, and **4** one for each ADC input channel. **IN 1** and **2** are input to the first ADS54J60 and **IN 3** and **4** are input to the second ADS54J60.
- **ADC Overload LEDs:** The red **OV** (overload) LED indicates either an overload in the associated ADS54J60 or an ADC FIFO overrun.
- **User LED:** The green **USR** LED is for user applications.
- **Analog Output Connectors:** Four coaxial connectors, labeled **DAC OUT 1**, **2**, **3**, and **4** for each DAC38J84 output.
- **Clock LED:** The green **EXT CLK IN** LED illuminates when a valid sample clock signal is detected. If the LED is not illuminated, no clock has been detected and no data from the input stream can be processed.
- **Over Temperature LED:** The red **TMP** LED illuminates when an over-temperature or over-voltage condition is indicated by any of the temperature/voltage sensors on the PCB.
- **Trigger Input Connector:** One coaxial connector labeled **TRG** for input of an external trigger.
- **Sync Bus Connector:** The 19-pin Sync Bus front panel connectors labeled **SYNC/GATE** provides sync and gate input signals for the Sync Bus.

FRONT PANEL CONNECTIONS

The 7070 carrier PCIe slot panel houses the front panel of the FMC module installed on the carrier. It includes three LED indicators and an optional PPS IN or Optical I/O connector.



- **LINK LED:** The green LNK (**L**) LED illuminates when a valid PCIe link has been established over the PCIe interface.
- **User LED:** The yellow **USR** LED is available for user applications.
- **Over Temperature LED:** The red (**T**) LED illuminates when an over-temperature or over-voltage condition is indicated by any of the temperature/voltage sensors on the model.
- **PPS Input Connector** (Option 120 only): With Option 120, a PPS IN connector on the standard front panel provides input of an external PPS or Sync signal. Without Option 120, the PPS IN connector is not active and is covered with a plug, as indicated by the dotted circle in the illustration.

SPECIFICATIONS

Front Panel Analog Signal Inputs

Input Type: Transformer-coupled, front panel connectors

Transformer Type: Coil Craft WBC1-1TLB

Full-Scale Input: +4 dBm into 50 ohms

3 dB Passband: 300 kHz to 750 MHz

A/D Converters

Type: Texas Instruments ADS54J60

Sampling Rate: Up to 500 MHz

Resolution: 16 bits

Front Panel Analog Signal Outputs

Output Type: Transformer-coupled, front panel connectors

Transformer Type: Coil Craft WBC4-6TLB

Full Scale Input: +4 dBm into 50 ohms

3 dB Passband: 300 kHz to 700 MHz

D/A Converters

Type: Texas Instruments DAC38J84

Input Data Rate: Up to 500 MHz

Output Sample Rate: Up to 2 GHz (with interpolation)

Resolution: 16 bits

Sample Clock Sources

On-board clock synthesizer generates two clocks: an A/D clock and a D/A clock

Clock Synthesizer

Clock Source: Selectable from on-board programmable VCXO (10 to 810 MHz) or front panel external clock or LVPECL timing bus

Synchronization: VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

Clock Dividers: External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D and D/A clocks

External Clock

Type: Front panel connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

External Trigger Input

Type: Front panel connector

Function: Programmable functions include: trigger, gate, sync and PPS

Field Programmable Gate Array

- Standard: Xilinx Virtex-7 XC7VX330T-2
- Option -076: Xilinx Virtex-7 XC7VX690T-2

Custom FPGA I/O

Parallel (Option -104): 16 pairs of LVDS connections between the FPGA and a card-edge connector for custom I/O

Optical (Option -110): 12x gigabit serial option I/O with XC7VX690T FPGA, 4x with XC7VX330T

Memory

Type: DDR3 SDRAM

Size: Four banks, 1 GB each

Speed: 800 MHz (1600 MHz DDR)

PCI-Express Interface

PCI Express Bus: Gen. 1, 2 or 3: x4 or x8

Environmental

Standard: L0 (air-cooled)

- Operating Temp: 0° to 50° C
- Storage Temp: -20° to 90° C
- Relative Humidity: 0 to 95%, non-condensing

Option -702: L2 (air-cooled)

- Operating Temp: -20° to 65° C
- Storage Temp: -40° to 100° C
- Relative Humidity: 0 to 95%, non-condensing

Option -763: L3 (conduction-cooled)

- Operating Temp: -40° to 70° C
- Storage Temp: -50° to 100° C
- Relative Humidity: 0 to 95%, non-condensing

Physical

Dimensions: PCIe card

- Depth: 201.6 mm (7.948 in)
- Height: 111.25 mm (4.376 in)

FLEXORSET MODELS

This chart shows all available FlexorSets. Click on model numbers for more information.

Form Factor	Software/FPGA Tools	Carrier Model	FMC Model	FlexorSet Model	Description

			3320	7070-320	2-Channel 3 GHz A/D & 2-Channel 2.8 GHz D/A
			3324	7070-324	4-Channel 500 MHz A/D & 4-Channel 2 GHz D/A

*Consult with Mercury about the availability of a 5983A version of this product. For differences, see below.

Model 5983	Model 5983A
Flash Memory - 1 Gbit of FLASH Memory	**Flash Memory -**2 Gbit of BPI FLASH Memory
Optical I/O (Option 110) - VITA 66.4 - Up to 12 duplex optical lanes are available on a VITA 66.4 connector. With the installation of a serial protocol, the VITA 66.4 interface enables a high-bandwidth connection between 5983s mounted in the same chassis or over extended distances.	**Optical I/O (Option 110) - VITA 67.3D -** Provides 12 duplex lanes @ 10 Gb/sec through the lower half of VPX P2 (VPX P2B). With the installation of a serial protocol, the VITA 67.3D interface enables gigabit communications between boards and chassis, independent of the PCIe interface. Consult with Mercury before ordering Option 110 (optical).
	Custom Analog I/O (Option 113) - VITA 67.3 - VITA 67.3 provides 10 coax connections through the lower half of VPX P2.

ORDERING INFORMATION

Model	Description
7070-324	4-Channel 500 MHz 16-bit A/D, 4-Channel 2 GHz 16-bit D/A with Virtex-7 FPGA - x8 PCIe

Options:	
-076	XC7VX690T-2 FPGA
-104	LVDS FPGA I/O to card-edge connector
-110	12x gigabit serial optical I/O with XC7VX690T FPGA, 4X with XC7VX330T
-702	Air-cooled, Level 2
-763	Conduction-cooled, Level 3

Contact Mercury for compatible option combinations and complete specifications of rugged and conduction-cooled versions. Options may change, so be sure to contact Mercury for the latest information.

ACCESSORY PRODUCTS

Model	Description
2171	Cable Kit: SSMC to SMA
7892	High-Speed Synchronizer and Distribution Board - PCIe Model
9192	Rackmount High-Speed System Synchronizer Unit Model

DEVELOPMENT SYSTEMS

Mercury offers development systems for Flexor products. They come with all pre-tested software and hardware ready for immediate operation. These systems are intended to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Flexor boards. Please contact Mercury to configure a system that matches your requirements.
